

❖ Solved problem

This system was created for sales managers for manage their team members. System can use by more than one manager and can have separate team for each.

As a sales manager user will be able to login, logout, add / edit / delete team members and import members from an existing excel file. Only managers are able to login to the system.

❖ Assumptions

- I assumed excel file will not contain any empty cells for corrupted values.
- Assumed one user belongs to one team only

❖ How to run

- ✓ Clone the github repository
- ✓ Run "*composer install*"
- ✓ Change the database name from the .env only if needed and run "*php artisan optimize*"
- ✓ Run "*php artisan migrate --seed*" (seed will create the first user from 'User Seeder')
- ✓ Run "*php artisan serve*". That's all.
- ✓ First user's login credentials. "UN : parker@gmail.com , PW : 12345678 "
